Foreword

Irrespective of social, economic, religious, cultural or any such factors, proper, effective and efficient healthcare services are needed by everyone. Providing such services becomes more challenging in India considering the vast diversity of the country. Due to this diversity, the need of healthcare services varies from State to State and region to region.

However, the Ministry of Health & Family Welfare is committed to provide the optimum healthcare services available to its entire population despite of all such challenges. The needs of the population have to be addressed by fully utilizing the existing capacities in the most effective and efficient manner, in addition to creating new capacities by way of additional infrastructure, human resources and introducing new programmes. The National Health Mission has placed considerable emphasis on this. However, to access the quantum of future needs in this direction as well as progresses so far, availability of reliable and timely data is crucial.

'Rural Health Statistics' an annual publication is based on Health care administrative data generated by the health care system. It is an effort towards providing reliable and updated information on rural health infrastructure. The data given in this publication are based on the information upto March 2018, provided by States and UTs. In line with Prime Minister's emphasis on Swachh Bharat Abhiyaan, the data on parameters pertaining to toilet facility availability at Sub Centres, Primary Health Centres and Community Health Centres has also been incorporated. Data regarding the AYUSH doctors at PHCs and CHCs level has been incorporated for the first time in this publication. It provides data on rural and tribal health infrastructure, human resources, distribution of facilities, trainings, availability of toilet facility etc., so as to provide the status of public health infrastructure available in the country.

The 'Rural Health Statistics' offers the most comprehensive source of comparable statistics on Rural health systems across the country. It is an essential tool to carry out comparative analyses and take policy decisions based on informed data. Findings based on this data can be vital to policymakers in understanding how utilization patterns differ among population subgroups and pinpointing geographic areas where problems are the most severe.

We will be happy to accept suggestions for further improvement of this publication.
